

Car crashes happen daily, killing many yearly. What we want to find is the severity of an accident based on other attributes. In the United States alone, thirty-six thousand people died in motor vehicle accidents, these are people with families, with loved ones, with lives. Imagine a world where the EMT could predict the severity and the type of damage while still in the ambulance. An AI capable of calculating such things could be life altering. This is the first step on this journey - on the journey of saving lives, and improving road safety. This is something that affects everyone, therefore my intended audience is everyone.
